

## CSC240\_Lab05: Interfaces and Abstract Classes

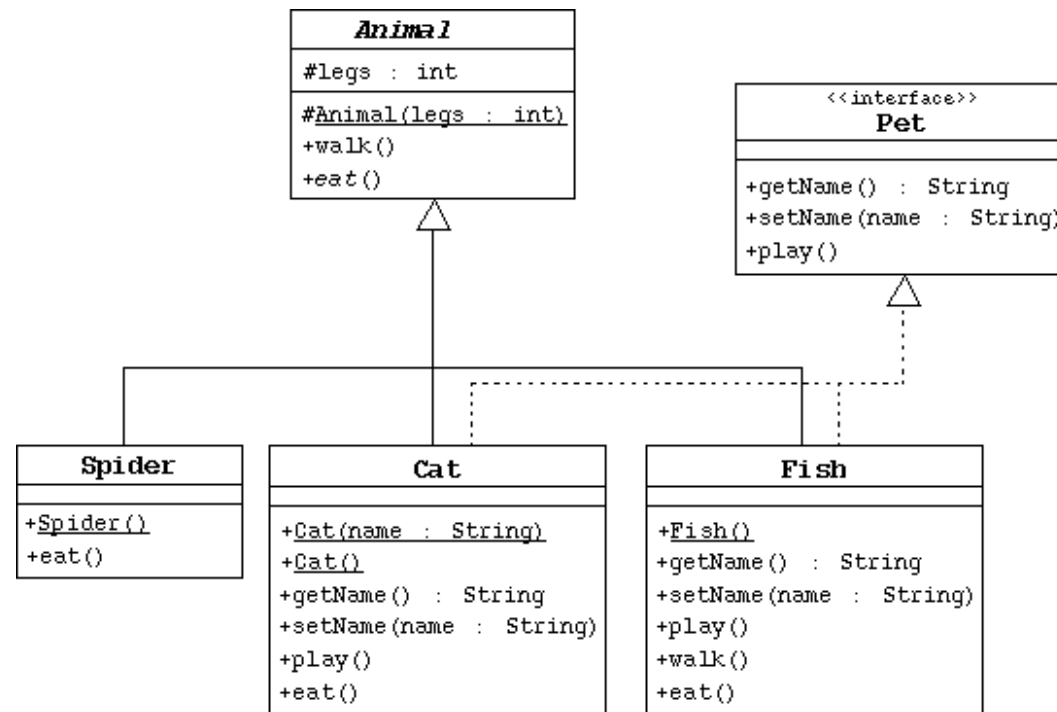

Points: **100** points.

### Objective:

In this exercise, you will create a hierarchy of animals that is rooted in an abstract class `Animal`. Several of the animal classes will implement an interface called `Pet`. You will experiment with variations of these animals, their methods, and polymorphism.

Experiment by:

- calling the methods in each object,
- casting objects,
- using polymorphism, and
- using `super` to call super class methods.

### Assignment:

1. Create the `Animal` class, which is the abstract superclass of all animals.
  - 1 Declare a protected integer attribute called `legs`, which records the number of legs for this animal.
  - 2 Define a protected constructor that initializes the `legs` attribute.
  - 3 Declare an abstract method `eat`.
  - 4 Declare a concrete method `walk` that prints out something about how the animals walks (include the number of legs).
2. Create the `Spider` class.
  - 1 The `Spider` class extends the `Animal` class.
  - 2 Define a default constructor that calls the superclass constructor to specify that all spiders have eight legs.
  - 3 Implement the `eat` method.
3. Create the `Pet` interface specified by the UML diagram.
4. Create the `Cat` class that extends `Animal` and implements `Pet`.
  - 1 This class must include a `String` attribute to store the name of the pet.
  - 2 Define a constructor that takes one `String` parameter that specifies the cat's name. This constructor must also call the superclass constructor to specify that all cats have four legs.
  - 3 Define another constructor that takes no parameters. Have this constructor call the previous constructor (using the `this` keyword) and pass an empty string as the argument.
  - 4 Implement the `Pet` interface methods.
  - 5 Implement the `eat` method.
5. Create the `Fish` class. Override the `Animal` methods to specify that `fish` can't walk and don't have legs.
6. Create an `TestAnimals` program. Have the main method create and manipulate instances of the classes you created above. Start with:

```
Fish d = new Fish();
Cat c = new Cat("Fluffy");
Animal a = new Fish();
Animal e = new Spider();
Pet p = new Cat();
```

### Instructions:

1. Develop and test the classes as described in the Assignment section above.
2. Your lab assignment should have only one Java file, namely; `TestAnimals.java` file that has all classes and interfaces you've implemented.
3. Upload `TestAnimals.java` and run output through D2L.
